BRIEF REPORT

Healthy Living? By Whose Standards? Engaging Mental Health Service Recipients to Understand Their Perspectives of, and Barriers to, Healthy Living

Objective: It is well recognized that mental health service recipients experience high rates of cardiometabolic disorders, have poorer diets, and exercise less than the general population. This study sought to explore the meaning of a healthy lifestyle for this population and the barriers they experience to healthy living. Method: Focus groups were conducted with 23 individuals who experience serious mental health issues. The meaning of a healthy lifestyle and the barriers participants experience to living healthfully were explored. Results: Participants perceived a healthy lifestyle in broader terms than professional guidelines for exercise and diet. A broad framework including friendship, affordable safe housing, employment, spiritual, and emotional good health, as well as healthy eating and exercise, is described. Barriers identified by participants were poor mental and physical health and stigma (structural, social, and self). An unexpected result was the group problem solving that occurred during the focus groups. Conclusions and Implications for Practice: Health care professionals need to understand mental health service recipients’ perspectives of a “healthy lifestyle.” An understanding of barriers within this context is required, as only then will we be able to empathize and assist as health care professionals. This study also shows that realistic, innovative, and pragmatic solutions occur when mental health service recipients are empowered.

Objective. Mental health service users experience high rates of cardiometabolic disorders and have a 20–25% shorter life expectancy than the general population from such disorders. Clinician-led health behavior programs have shown moderate improvements, for mental health service users, in managing aspects of cardiometabolic disorders. This study sought to potentially enhance health initiatives by exploring (1) facilitators that help mental health service users engage in better health behaviors and (2) the types of health programs mental health service users want to develop. Methods. A qualitative study utilizing focus groups was conducted with 37 mental health service users attending a psychosocial rehabilitation center, in Northern British Columbia, Canada. Results. Four major facilitator themes were identified: (1) factors of empowerment, self-value, and personal growth; (2) the need for social support; (3) pragmatic aspects of motivation and planning; and (4) access. Participants believed that engaging with programs of physical activity, nutrition, creativity, and illness support would motivate them to live more healthily. Conclusions and Implications for Practice. Being able to contribute to health behavior programs, feeling valued and able to experience personal growth are vital factors to engage mental health service users in health programs. Clinicians and health care policy makers need to account for these considerations to improve success of health improvement initiatives for this population.
Background

Individuals with severe mental illness (SMI) have elevated rates of physical ill health including cardio-metabolic disease (Olfson et al., 2015; Saha et al., 2007). The prevalence of type 2 diabetes in individuals with schizophrenia is 2–4 times higher than that in the general population (Holt et al., 2005; Mezuk et al., 2008).
Individuals with SMI have a 20% shorter life expectancy (Marder et al., 2004)

Lifestyle factors include rates of smoking, excess caloric intake, poor diet, & lack of exercise (Nolte & Martin, 2008; Robson & Gray, 2007)
Targeted behavioral interventions show clinically significant health improvements & impact on cardiometabolic risk reduction for MHSUs (Bartels et al., 2013, 2015; Daumit et al., 2013; Green et al., 2015)

Attrition from such programs by individuals with SMI is reported to be high (Brown & Chan, 2006; Kemp et al., 2009).

Peer-led interventions: an under-utilized approach

- **Peer-facilitation is effective** (Ashton et al., 2013; Dickerson et al., 2016; Druss et al., 2010 Ford et al., 2013)

- **Provides social support & role-modeling** (Gray et al., 2013)

- **Promising model to increase effectiveness & reach of health interventions** (Chinman et al., 2014; Ginis et al., 2013).
prevalence of type 2 diabetes in individuals with schizophrenia is 2–4 times higher than that in the general population (Holt et al., 2005; Mezuk et al., 2008).

Purpose

• Explore program feasibility & acceptability
• Evaluate peer-developed & peer-led physical activity programs tailored for MHSUs
Theoretical framework

Informed by:

2) Community-based participatory research (Israel et al., 1998; 2005)

Producing:
3) Participant And Community Empowerment (PACE) (Graham et al., 2017 in preparation)
Physical Activity Programs

1) Peer-led walking program;

2) Yoga program;

3) Fitness program developed with the YMCA.
Evaluation

Focus groups (6- and 12-month)

“How has it been participating in the health program(s) you have been involved with?”

“Have you observed any benefits / harms in participating?”

“What has worked well for you / what has been difficult for you in the program(s)?”

“How could it be changed to be better?”

</tbody>
</table>
Discussion

First reported evaluation of peer-developed, peer-led PA programs

Peer Lead coaching & leadership skills development are required
Theory of Engagement & Change

1. Engagement resides in accessibility

First study to identify geographical accessibility/psychosocial belonging as part of engagement

2. Behaviour change resides in co-constituent relationships
Other considerations

Dropout a challenge – need *forgiving flexibility*

Role of *self-determination & empowerment*
Limitations

• Selection bias

• Economic incentives
Conclusion

Feasibility & acceptability

Integration of concepts of accessibility & relationships

Replication needed
